(57) Abstract :

The invention focuses on revolutionizing dermatological diagnostics using artificial intelligence (AI) and emergency care solutions. Utilizing the InceptionV3 architecture within Convolutional Neural Networks (CNNs), it offers accurate skin disease diagnosis. The model is trained on the comprehensive DermaNet dataset, enabling swift classification of various skin conditions based on images uploaded by users. To enhance accessibility, a WhatsApp bot (102) is integrated, allowing users to interact seamlessly and receive detailed diagnostic reports, severity analyses, and emergency treatment suggestions. The bot also assists users in finding nearby clinics by enabling location sharing. This system bridges gaps in healthcare, especially for underserved populations, by providing real-time, affordable, and high-quality diagnostic and treatment services. Through its innovative approach, the invention highlights the transformative potential of AI in improving dermatological care and accessibility for all.
